

*High capacity customized forklifts for marine, agriculture, construction, military, mining, and more.*

## **Driveline Lubrication Procedure**

*The purpose of this procedure is to lubricate the drivelines used on Wiggins E-bulls, which Wiggins recommends doing every 500 hours of operation.*

### **Tools/Materials**

- Grease gun
- Grease (the same grease used for lubricating the carriage)

### **Procedure**

1. Remove the fasteners connecting the driveline's U-joint to the axle.

*High capacity customized forklifts for marine, agriculture, construction, military, mining, and more.*

2. Rotate the driveline and use a grease gun on both U-joint fittings to lubricate.
  - a. With the axle side disconnected the driveline should rotate freely.

*High capacity customized forklifts for marine, agriculture, construction, military, mining, and more.*

3. Slide the driveline open and use the grease gun on the fitting to lubricate the shaft.
  - a. Do not add grease while the driveline is collapsed
  - b. Do not over-grease, excessive greasing will blow out seals

4. Collapse the driveline and reconnect it to the axle
